SyncManager is a standalone application that can be used to regularly synchronize folders located on a local hard drive, flash drive or network share. It ensures that each version of each file is saved in two places. This allows you to safely restore data that might be damaged or corrupted, and should the source folder be compromised, the data in the target folder will be identical to the original. You can have an overview of all the ongoing tasks at any given moment, and control them manually if you wish. For obvious reasons, we recommend using a USB drive or an external hard drive, which are easier to handle and more likely to be protected. The application runs in the background at all times, so you do not have to worry about constantly running it. This way, you can add a task whenever you like, and SyncManager will ensure that the files are saved in two places, even if one of them is temporarily removed. You will need to specify the source and target folders, and choose between a manual or automatic sync. If you want to use the app to back up your files, be sure to select the option corresponding to this function. You will also need to set the desired interval between the backup jobs. If you wish to do it daily, choose one from the drop-down list.
