Download Video Pro APK for Android 5/6 by Pinch Me (Video Downloader - Pro).u off-line workloads are well known to be more expensive to write. Overall, if you are doing relatively little write and no considerable gains are experienced by using the I/O buffer cache, you may want to consider disabling it. If you're on a newer SSD and it is equipped with an ESD, enabling the ESD can be a very valuable feature. Congratulations! You've successfully written your first data. Before finishing, let me give you some important hints. Even with the help of the SSD caching, there are many different things happening inside the SSD in order to get data to you as soon as possible. As a general rule of thumb, the less time it takes for the SSD to find the data and retrieve it, the better. At the same time, you don't want to access your data too much, or the SSD could be subjected to high write workloads. The duration of a write operation is mostly determined by the number of cache misses. It is possible that initially you'll see some performance gains, because caching makes it so that more data is available in the cache buffer. However, if caching is enabling you to access the drive any longer or if it's significantly impacting the overall speed of the drive, it might be time to disable it. Unfortunately, once you do enable the cache, you don't have the option to disable it. To disable the cache, you'll have to use the Utilities menu and click on Cache Settings and then select "Disable." If you've enabled the cache, you'll also notice that there is an option to "Enable Cache." Once again, this is something you'll have to uncheck. The other option in the Cache Settings menu is to select the size of the cache, which I recommend you disable. There is also a cache preference for writes, but I've discovered that there is no real difference in performance. To test the effectiveness of the cache, log out and log back in. Then, fire up the Amazon FPS benchmark. Hit the Performance tab, and switch to the Cache Performance tab
